

Find out the **TOP 10 reasons** to choose an eAuditor

Reason #1 Web console

Our platform is a web-based and responsive system that offers a wide range of integrations and possibilities. Thanks to a clear and transparent interface, operation is easy and intuitive. Full mobility provided by the web interface allows you to manage your IT infrastructure from anywhere and from any device with Internet access.

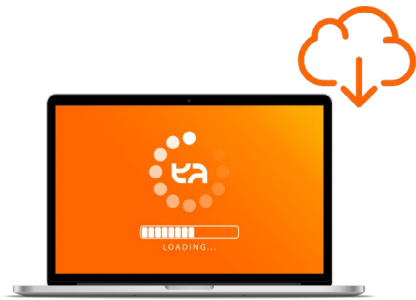

Reason #2 IT security

With eAuditor, you can be sure that your infrastructure is protected at every step. Encrypted connections, system security tests and the use of Microsoft Bitlocker are just some of our solutions to protect your data.

Reason #3 Comprehensive support

Support at every stage. Together with eAuditor, you receive not only a product, but also comprehensive support. Our team provides technical support and provides additional materials, videos and webinars so that you can make the most of the potential of our system.

Reason #4

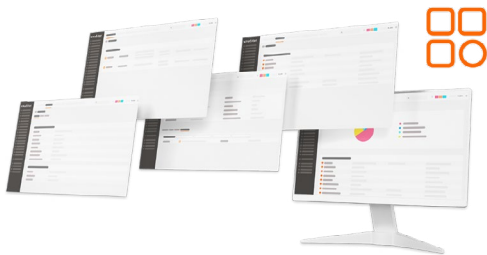

Remote installation

Remote installation of .msi and .exe files, including automatic installation and application kiosk, are key elements of effective IT infrastructure management. Thanks to this solution, administrators can quickly and seamlessly deploy the necessary software on multiple devices simultaneously, significantly reducing the time and costs associated with manual installation.

Reason #5

Polish producer

We are a Polish producer adapted to national legal regulations. Our solution is compliant with applicable regulations, including GDPR, so you can be sure that when using our services, you meet all legal requirements.

Reason #6

Moduleless system

Our system is a comprehensive solution without modules, which eliminates the need to select key management elements at the very beginning of activities. Our solution is designed to meet the diverse needs of customers.

Reason #7

Open API

It enables full system adaptation, e.g. integration with the Hyprovision DLP system, which provides monitoring, flow control, and blocking data leakage and theft.

Reason #8

Remote desktop

It enables effective real-time communication over the Internet, providing remote access and the ability to operate on networked computers, even in the case of NAT. This is particularly useful in the area of technical support, eliminating the need to use additional tools dedicated exclusively to these tasks.

Reason #9

Artificial Intelligence

We use Machine and Deep Learning mechanisms to provide additional safety oversight by analyzing processes and user pages visited. What's new in the system is integration with ChatGPT and authentication using facial recognition.

Reason #10

Employee Panel

Our web application gives employees full control over their work and IT infrastructure, allowing them to independently manage tasks. This approach significantly increases engagement and employee performance. Additionally, the application enables comprehensive inventory with the option of attaching documents, which optimizes the use of IT resources.
